

Abstract

Susanna Lindberg
Lost in Techno-Nature

- Contemporary environmental concerns are distinctively planetary. In this paper I will show how it obliges to reconsider the concept of world inherited from phenomenology, which has become insufficient in the present situation. I will develop it in terms an idea of "bio-technics", which is a term I have developed elsewhere in order to rethink the relation between technics and nature today: it is not a technology among others, but as an elemental dimension of the world. I will also open the question of what taking care of the inappropriable planetary space could mean.
