I am interested in deciphering the **evolutionary mechanisms**, at different scales (from atoms to microbial communities) underlying the evolution of **metabolism** during bacterial adaptation.

We investigate keystone bacterial taxa and their specialized metabolism emerging after ecological **host-microbiome interactions** studies, mainly in plants and insects.

We dissect the roles played by natural products in mediating **microbial interactions**, as well as deciphering novel **biosynthetic logics** leading to unprecedented **chemical scaffolds**.

Based in this basic knowledge, we develop **bioinformatics tools for genome mining** of natural products and **biotechnological applications**, mainly for agriculture.

Microbial Biodiversity and Specialized Metabolism Laboratory

Sub-community co-cultures
(cycads, tomato)

National Institutes
of Health

Co-exist or interacts?
metabolic exchange, *novel
microbiome mechanisms*

Genome Mining
(EvoMining, CORASON)

Promiscuomics
(enzyme sub-families)

Substrate specificity? enzyme
promiscuity, *novel chemical
conversions*

Pathway assembly?
enzyme recruitment, *novel
biosynthetic logics*

The Dynamic Chemical Matrix Evolutionary (DCME) hypothesis

*“The **chemical matrix hypothesis** stems from the idea that secondary / specialized metabolism evolves from increased metabolic diversity driven by the concerted action of promiscuous enzymes.... BGCs are therefore evolutionary unstable and only the output of this process. Thus, **fitness landscapes**, defined by the relationship between relative fitness (W), chemical structure (S) and biomolecular activity (F) are a more appropriate representation of the evolution of natural products biosynthesis”*

1. Expansion-and-recruitment of promiscuous enzymes is the raw (and constant) material for the evolution of NPs (**EvoMining**)
2. NPs evolve after a dynamic gene clustering that increases chemical diversity (**CORASON**)

3. NPs are responsive at the population level to environmental conditions and the composition of the community (**EcoMining – Experimental. PopGenNP - computational**)
